

HIGHLIGHTS OF PRESCRIBING INFORMATION

These highlights do not include all the information needed to use ONGENTYS® safely and effectively. See full prescribing information for ONGENTYS®.

ONGENTYS (opicapone) capsules, for oral use

Initial U.S. Approval: 2020

INDICATIONS AND USAGE

ONGENTYS is a catechol-O-methyltransferase (COMT) inhibitor indicated as adjunctive treatment to levodopa/carbidopa in patients with Parkinson's disease (PD) experiencing "off" episodes. (1)

DOSAGE AND ADMINISTRATION

- The recommended dosage is 50 mg administered orally once daily at bedtime. (2.1)
- Patients should not eat food for 1 hour before and for at least 1 hour after intake of ONGENTYS. (2.1)
- The recommended dosage in patients with moderate hepatic impairment is 25 mg orally once daily at bedtime; avoid use in patients with severe hepatic impairment. (2.2)

DOSAGE FORMS AND STRENGTHS

Capsules: 25 mg and 50 mg. (3)

CONTRAINDICATIONS

- Concomitant use of non-selective monoamine oxidase (MAO) inhibitors. (4)
- History of pheochromocytoma, paraganglioma, or other catecholamine secreting neoplasms. (4)

WARNINGS AND PRECAUTIONS

- Cardiovascular Effects with Concomitant Use of Drugs Metabolized by Catechol-O-Methyltransferase (COMT): May cause arrhythmias, increased heart rate, and excessive changes in blood pressure. Monitor patients when treated concomitantly with products metabolized by COMT. (4, 5.1)

- Falling Asleep During Activities of Daily Living: Advise patients prior to treatment. (5.2)
- Hypotension/Syncope: If occurs, consider discontinuing ONGENTYS or adjusting dosage of other medications that can lower blood pressure. (5.3)
- Dyskinesia: May cause or exacerbate dyskinesia; consider levodopa or dopaminergic medication dose reduction. (5.4)
- Hallucinations and Psychosis: Consider stopping ONGENTYS if occurs. (5.5)
- Impulse Control/Compulsive Disorders: Consider stopping ONGENTYS if occurs. (5.6)
- Withdrawal-Emergent Hyperpyrexia and Confusion: When discontinuing ONGENTYS, monitor patients and consider adjustment of other dopaminergic therapies as needed. (5.7)

ADVERSE REACTIONS

Most common adverse reactions ($\geq 4\%$ and $>$ placebo): dyskinesia, constipation, blood creatine kinase increased, hypotension/syncope, and weight decreased. (6.1)

To report SUSPECTED ADVERSE REACTIONS, contact Neurocrine Biosciences, Inc. at 877-641-3461 or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch.

USE IN SPECIFIC POPULATIONS

- Pregnancy: Based on animal data, may cause fetal harm (8.1)
- Avoid use in patients with end-stage renal disease. (8.6)

See 17 for PATIENT COUNSELING INFORMATION and FDA-approved patient labeling.

Revised: 4/2020

FULL PRESCRIBING INFORMATION

1 INDICATIONS AND USAGE

ONGENTYS is indicated as adjunctive treatment to levodopa/carbidopa in patients with Parkinson's disease (PD) experiencing "off" episodes.

2 DOSAGE AND ADMINISTRATION

2.1 Dosing and Administration Information

The recommended dosage of ONGENTYS is 50 mg administered orally once daily at bedtime. Patients should not eat food for 1 hour before and for at least 1 hour after intake of ONGENTYS [see *Clinical Pharmacology (12.3)*].

2.2 Dosage Recommendations for Patients with Hepatic Impairment

In patients with moderate hepatic impairment (Child-Pugh B), the recommended dose of ONGENTYS is 25 mg orally once daily at bedtime [see *Use in Specific Populations (8.7)*, *Clinical Pharmacology (12.3)*].

Avoid use of ONGENTYS in patients with severe (Child-Pugh C) hepatic impairment [see *Use in Specific Populations (8.7)*, *Clinical Pharmacology (12.3)*].

2.3 Discontinuation and Missed Dose

When discontinuing ONGENTYS, monitor patients and consider adjustment of other dopaminergic therapies as needed. If a dose of ONGENTYS is missed, the next dose should be taken at the scheduled time the next day.

3 DOSAGE FORMS AND STRENGTHS

ONGENTYS capsules are available in the following strengths:

- 50 mg capsules with a dark blue opaque cap and dark pink opaque body; axially printed with "OPC" over "50" in white ink, on both the cap and body.
- 25 mg capsules with a light blue opaque cap and light pink opaque body; axially printed with "OPC" over "25" in blue ink, on both the cap and body.

4 CONTRAINDICATIONS

ONGENTYS is contraindicated in patients with:

- Concomitant use of non-selective monoamine oxidase (MAO) inhibitors [see *Drug Interactions (7.1)*].
- Pheochromocytoma, paraganglioma, or other catecholamine secreting neoplasms.

5 WARNINGS AND PRECAUTIONS

5.1 Cardiovascular Effects with Concomitant Use of Drugs Metabolized by Catechol-O-Methyltransferase (COMT)

Possible arrhythmias, increased heart rate, and excessive changes in blood pressure may occur with concomitant use of ONGENTYS and drugs metabolized by COMT (e.g., isoproterenol, epinephrine, norepinephrine, dopamine, and dobutamine), regardless of the route of administration (including inhalation). Monitor patients treated concomitantly with ONGENTYS and drugs metabolized by COMT [see *Contraindications (4)*, *Drug Interactions (7.1, 7.2)*].

5.2 Falling Asleep During Activities of Daily Living and Somnolence

Patients treated with dopaminergic medications and medications that increase levodopa exposure, including ONGENTYS, have reported falling asleep while engaged in activities of daily living, including the operation of motor vehicles, which sometimes has resulted in accidents. Patients may not perceive warning signs, such as excessive drowsiness, or they may report feeling alert immediately prior to the event.

Before initiating treatment with ONGENTYS, advise patients of the potential to develop drowsiness and specifically ask about factors that may increase the risk for somnolence with dopaminergic therapy, such as concomitant sedating medications or the presence of a sleep disorder. If a patient develops daytime sleepiness or episodes of falling asleep during activities that require full attention (e.g., driving a motor vehicle, conversations, eating), consider discontinuing ONGENTYS or adjusting other dopaminergic or sedating medications. If a decision is made to continue ONGENTYS, patients should be advised not to drive and to avoid other potentially dangerous activities.

5.3 Hypotension/Syncope

In Study 1 and Study 2 [see *Clinical Studies (14)*], hypotension (orthostatic and non-orthostatic), syncope, and presyncope occurred in 5% of patients treated with ONGENTYS 50 mg compared to 1% of patients who received placebo. Monitor patients for hypotension (orthostatic and non-orthostatic) and advise patients about the risk for syncope and presyncope. If these adverse reactions occur, consider discontinuing ONGENTYS or adjusting the dosage of other medications that can lower blood pressure.

5.4 Dyskinesia

ONGENTYS potentiates the effects of levodopa [see *Clinical Pharmacology (12.3)*] and may cause dyskinesia or exacerbate pre-existing dyskinesia.

In controlled clinical trials (Study 1 and Study 2) [see *Clinical Studies (14)*], dyskinesia occurred in 20% of patients treated with ONGENTYS 50 mg compared to 6% of patients who received placebo. Dyskinesia was also the most common adverse reaction leading to discontinuation of ONGENTYS [see *Adverse Reactions (6.1)*].

Reducing the patient's daily levodopa dosage or the dosage of another dopaminergic drug may mitigate dyskinesia that occurs during treatment with ONGENTYS.

5.5 Hallucinations and Psychosis

In Study 1 and Study 2, hallucinations (hallucinations, auditory hallucinations, visual hallucinations, mixed hallucinations) occurred in 3% of patients treated with ONGENTYS 50 mg compared to 1% of patients who received placebo. Delusions, agitation, or aggressive behavior occurred in 1% of patients treated with ONGENTYS 50 mg, and in no patient who received placebo. Consider stopping ONGENTYS if hallucinations or psychotic-like behaviors occur.

Patients with a major psychotic disorder should ordinarily not be treated with ONGENTYS because of the risk of exacerbating the psychosis with an increase in central dopaminergic tone. In addition, treatments for psychosis that antagonize the effects of dopaminergic medications may exacerbate the symptoms of PD.

5.6 Impulse Control/Compulsive Disorders

Patients treated with ONGENTYS can experience intense urges to gamble, increased sexual urges, intense urges to spend money, binge eating, and/or other intense urges, and the inability to control these urges while taking one or more dopaminergic therapies that increase central dopaminergic tone. In some cases, these urges were reported to have stopped when the dose was reduced, or the medication was discontinued. Because patients may not recognize these behaviors as abnormal, it is important for prescribers to specifically ask patients or their caregivers about the development of new or increased gambling urges, sexual urges, uncontrolled spending, or other urges while being treated with ONGENTYS.

In Study 1 and Study 2, impulse control disorders occurred in 1% of patients treated with ONGENTYS 50 mg, and in no patient who received placebo. Re-evaluate the patient's current therapy(ies) for Parkinson's disease and consider stopping ONGENTYS if a patient develops such urges while taking ONGENTYS.

Use with caution in Parkinson's patients with suspected or diagnosed dopamine dysregulation syndrome.

5.7 Withdrawal-Emergent Hyperpyrexia and Confusion

A symptom complex resembling neuroleptic malignant syndrome (characterized by elevated temperature, muscular rigidity, altered consciousness, and autonomic instability), with no other obvious etiology, has been reported in association with rapid dose reduction, withdrawal of, or changes in drugs that increase central dopaminergic tone. In the controlled clinical studies of ONGENTYS, patients discontinued ONGENTYS treatment without dose tapering or gradual withdrawal. There were no reports of neuroleptic malignant syndrome in ONGENTYS controlled clinical studies. When discontinuing ONGENTYS, monitor patients and consider adjustment of other dopaminergic therapies as needed [see *Dosage and Administration (2.3)*].

6 ADVERSE REACTIONS

The following clinically significant adverse reactions are discussed in more detail in other sections of the labeling:

- Cardiovascular Effects with Concomitant Use of Drugs Metabolized by Catechol-O-Methyltransferase (COMT) [see *Warnings and Precautions (5.1)*]
- Falling Asleep During Activities of Daily Living and Somnolence [see *Warnings and Precautions (5.2)*]
- Hypotension/Syncope [see *Warnings and Precautions (5.3)*]
- Dyskinesia [see *Warnings and Precautions (5.4)*]
- Hallucinations and Psychosis [see *Warnings and Precautions (5.5)*]
- Impulse Control/Compulsive Disorders [see *Warnings and Precautions (5.6)*]
- Withdrawal-Emergent Hyperpyrexia and Confusion [see *Warnings and Precautions (5.7)*]

6.1 Clinical Trials Experience

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in practice.

The safety of ONGENTYS was evaluated in 265 patients with Parkinson’s disease (PD) in two 14-15 week placebo- and active-controlled (Study 1) or placebo-controlled (Study 2) studies [see *Clinical Studies (14)*]. All patients were taking a stable dose of levodopa and a DOPA decarboxylase inhibitor, alone or in combination with other PD medications. In Study 1 and Study 2, the mean age of patients was 63.6 years, 59% of patients were male, and 89% of patients were Caucasian. At baseline, the mean duration of PD was 7.6 years.

Adverse Reactions Leading to Discontinuation of Treatment

In Study 1 and Study 2, a total of 8% of ONGENTYS 50 mg-treated patients and 6% of patients who received placebo discontinued due to adverse events. The most common adverse reaction leading to discontinuation was dyskinesia, reported in 3% of ONGENTYS 50 mg-treated patients and 0.4% of patients who received placebo.

Common Adverse Reactions

Adverse reactions that occurred in the pooled studies at an incidence of at least 2% and greater than placebo are presented in Table 1. The most common adverse reactions (incidence at least 4% and greater than placebo) were dyskinesia, constipation, blood creatine kinase increased, hypotension/syncope, and weight decreased.

Table 1: Adverse Reactions with an Incidence of at Least 2% in Patients Treated with ONGENTYS and Greater than on Placebo, in Pooled Study 1 and Study 2

Adverse Reactions	ONGENTYS 50 mg N=265 %	Placebo N=257 %
Nervous system disorders		
Dyskinesia	20	6
Dizziness	3	1
Gastrointestinal disorders		
Constipation	6	2
Dry mouth	3	1
Psychiatric disorders		
Hallucination ¹	3	1
Insomnia	3	2
Investigations		
Blood creatine kinase increased	5	2
Weight decreased	4	0
Vascular disorders		
Hypotension/syncope ²	5	1
Hypertension	3	2

¹ Includes hallucinations, hallucinations visual, hallucinations auditory, and hallucinations mixed

² Includes hypotension, orthostatic hypotension, syncope, and presyncope

7 DRUG INTERACTIONS

7.1 Non-Selective Monoamine Oxidase (MAO) Inhibitors

Both ONGENTYS and non-selective MAO inhibitors (e.g., phenelzine, isocarboxazid, and tranylcypromine) inhibit catecholamine metabolism, leading to increased levels of catecholamines. Concomitant use may increase the risk of possible arrhythmias, increased heart rate, and excessive changes in blood pressure.

Concomitant use of ONGENTYS with non-selective MAO inhibitors is contraindicated [see *Contraindications (4)*]. Selective MAO-B inhibitors can be used concomitantly with ONGENTYS.

7.2 Effect of ONGENTYS on Other Drugs

Drugs Metabolized by Catechol-O-Methyltransferase (COMT)

Concomitant use of ONGENTYS with drugs metabolized by COMT may affect the pharmacokinetics of those drugs, which may increase the risk of possible arrhythmias, increased heart rate, and excessive changes in blood pressure [see *Warnings and Precautions (5.1)*]. Drugs known to be metabolized by COMT should be administered with caution. Monitor for changes in heart rate, rhythm, and blood pressure in patients concomitantly treated with ONGENTYS and drugs metabolized by COMT [see *Warnings and Precautions (5.1)*].

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

Risk Summary

There are no adequate data on the developmental risk associated with use of ONGENTYS in pregnant women. In animal studies, oral administration of opicapone during pregnancy resulted in adverse effects on embryofetal development (increased incidence of fetal abnormalities) at clinically relevant plasma exposures in one of two species tested. In addition, opicapone is always given concomitantly with levodopa/carbidopa, which is known to cause developmental toxicity in rabbits (*see Data*).

The background risk of major birth defects and miscarriage in the U.S. general population is 2-4% and 15-20% of clinically recognized pregnancies, respectively. The background risk for major birth defects and miscarriage in patients with Parkinson's disease is unknown.

Data

Animal Data

Oral administration of opicapone (0, 150, 375, or 1000 mg/kg/day) to pregnant rats throughout gestation resulted in no adverse effects on embryofetal development. Plasma exposure (AUC) at the highest dose tested (1000 mg/kg/day) was approximately 40 times that in humans at the recommended human dose (50 mg/day).

In pregnant rabbits, oral administration of opicapone (0, 100, 175, or 225 mg/kg/day) during the period of organogenesis resulted in increased incidence of structural abnormalities at all doses tested; maternal toxicity was observed at all but the lowest dose tested. A no-effect dose for adverse effects on embryofetal development was not identified. Plasma exposure (AUC) at the low-effect dose (100 mg/kg/day) was less than that in humans at the RHD.

Oral administration of opicapone (0, 150, 375, or 1000 mg/kg/day) throughout gestation and lactation resulted in no adverse effects on pre- and postnatal development; however, effects on neurobehavioral development in the offspring were not rigorously assessed. Plasma exposure (AUC) at the highest dose tested (1000 mg/kg/day) was approximately 40 times that in humans at the RHD.

Opicapone is always given concomitantly with levodopa/carbidopa, which is known to cause visceral and skeletal malformations in rabbits. The developmental toxicity of opicapone in combination with levodopa/carbidopa was not assessed in animals.

8.2 Lactation

Risk Summary

There are no data on the presence of opicapone in human milk, the effects on the breastfed infant, or the effects on milk production. In lactating rats, oral administration of opicapone resulted in levels of opicapone or metabolites in milk similar to those in maternal plasma. The developmental and health benefits of breastfeeding should be considered along with the mother's clinical need for ONGENTYS and any potential adverse effects on the breastfed infant from ONGENTYS or from the underlying maternal condition.

8.4 Pediatric Use

Safety and effectiveness in pediatric patients have not been established.

8.5 Geriatric Use

No dose adjustment is required for elderly patients. Of the total number of patients who received ONGENTYS 50 mg in Study 1 and Study 2, 52% of patients were 65 years and older. No overall differences in safety and effectiveness were observed between these patients and younger patients, but greater sensitivity to adverse reactions of some older individuals cannot be ruled out.

8.6 Renal Impairment

The renal route of elimination plays a minor role in the clearance of opicapone [see *Clinical Pharmacology (12.3)*]. Avoid use of ONGENTYS in patients with end-stage renal disease (ESRD) (CLcr <15 mL/min). No dosage adjustment is required for patients with mild, moderate, or severe renal impairment. However, because of a potential for increased exposure, monitor patients with severe renal impairment for adverse reactions and discontinue ONGENTYS if tolerability issues arise.

8.7 Hepatic Impairment

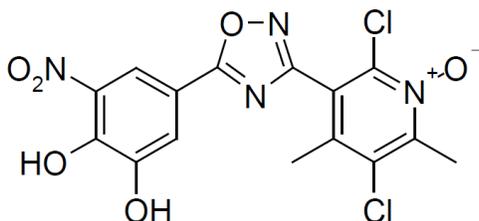

Opicapone exposure is increased in patients with hepatic impairment [see *Clinical Pharmacology (12.3)*]. Avoid use of ONGENTYS in patients with severe (Child-Pugh C) hepatic impairment. Dosage adjustment is recommended for patients with moderate (Child-Pugh B) hepatic impairment [see *Dosage and Administration (2.2)*]. No dosage adjustment is required in patients with mild (Child-Pugh A) hepatic impairment.

10 OVERDOSAGE

No specific antidotes for ONGENTYS are known. As a general measure, removal of ONGENTYS by gastric lavage and/or inactivation by administering activated charcoal should be considered. In managing overdose, provide supportive care, including close medical supervision and monitoring, and consider the possibility of multiple drug involvement. If an over-exposure occurs, call your poison control center at 1-800-222-1222 or www.poison.org.

11 DESCRIPTION

ONGENTYS contains opicapone, a peripheral, selective and reversible catechol-O-methyltransferase (COMT) inhibitor. The chemical name of opicapone is 2,5-dichloro-3-(5-(3,4-dihydroxy-5-nitrophenyl)-1,2,4-oxadiazol-3-yl)-4,6-dimethylpyridine-1-oxide with the following structure:

The opicapone molecular formula is C₁₅H₁₀Cl₂N₄O₆; and its molecular weight is 413.17.

Opicapone is a yellow powder/crystalline solid with limited aqueous solubility.

ONGENTYS capsules are intended for oral administration. Each capsule contains 25 mg or 50 mg of opicapone. ONGENTYS also contains the following inactive ingredients: lactose, magnesium stearate, pregelatinized starch, and sodium starch glycolate. The capsule shells contain: FD&C Blue#2, FD&C Red#3, gelatin, and titanium dioxide.

12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action

Opicapone is a selective and reversible inhibitor of catechol-O-methyltransferase (COMT).

COMT catalyzes the transfer of the methyl group of S-adenosyl-L-methionine to the phenolic group of substrates that contain a catechol structure. Physiological substrates of COMT include DOPA, catecholamines (dopamine, norepinephrine, and epinephrine), and their hydroxylated metabolites. When decarboxylation of levodopa is prevented by carbidopa, COMT becomes the major metabolizing enzyme for levodopa, catalyzing its metabolism to 3-methoxy-4-hydroxy-L-phenylalanine (3-OMD).

12.2 Pharmacodynamics

COMT Activity

Once-daily administration of ONGENTYS 50 mg caused inhibition of COMT activity in erythrocytes; the maximal inhibition seen was 84% and was maintained >65% over a 24-hour dosing interval in patients with Parkinson's disease. Following termination of treatment, COMT inhibition slowly returns to baseline levels, with >35% inhibition still observed 5 days after the last dose.

Effects on Levodopa

Peak (C_{max}) and overall levodopa exposure (AUC) increased by 43-44% and 62-94%, respectively, in PD patients following once-daily administration of ONGENTYS at bedtime with levodopa/carbidopa administered every three or every four hours, as compared to after administration of levodopa/carbidopa alone.

Cardiac Electrophysiology

At a dose 16 times the recommended dosage, ONGENTYS does not prolong the QT interval to any clinically relevant extent.

12.3 Pharmacokinetics

Opicapone demonstrates dose-proportional pharmacokinetics over a 25 mg (0.5 times the recommended dosage) to 50 mg dose range. The pharmacokinetics of opicapone are similar in both PD patients and healthy subjects.

Absorption

After single-dose administration of ONGENTYS 50 mg, the median (range) plasma T_{max} value was 2.0 (1.0-4.0) hours.

Effect of Food

Following a moderate fat/moderate calorie meal, the mean peak plasma concentration (C_{max}) for opicapone decreased 62%, the mean overall plasma exposure (AUC) decreased 31%, and the T_{max} was delayed by 4 hours. In Study 1, ONGENTYS was administered without regard to food. In Study 2, ONGENTYS administration and food consumption were separated by 1 hour [see *Dosage and Administration (2.1), Clinical Studies (14)*].

Distribution

Opicapone is highly bound to plasma proteins (>99%), which is independent of concentration.

Elimination

The mean elimination half-life of opicapone is 1 to 2 hours.

Metabolism

Sulphation is the primary metabolic pathway of opicapone, based on clinical studies and in vitro assessments. Other metabolic pathways include glucuronidation, methylation (by COMT), reduction, and glutathione conjugation.

Excretion

After administration of a single dose of radiolabeled opicapone 100 mg (2 times the recommended dosage) to healthy subjects, approximately 70% of the dose was recovered in feces (22% as unchanged), 20% in expired air, and 5% in urine (<1% as unchanged).

Specific Populations

No clinically significant differences in the pharmacokinetics of opicapone were observed based on age (i.e., 18 to 40 years of age and ≥ 65 years of age), sex, or race/ethnicity (i.e., Japanese, Caucasian, Asian, and Black).

Renal Impairment

Based on population pharmacokinetic analyses, no clinically significant differences in the pharmacokinetics of opicapone were observed in patients with mild or moderate renal impairment (CL_{Cr} 30-89 mL/min using the Cockcroft-Gault equation) relative to those with normal renal function (CL_{Cr} >90 mL/min). Patients with severe renal impairment or ESRD (CL_{Cr} <30 mL/min) have not been studied [see *Use in Specific Populations* (8.6)].

Hepatic Impairment

The single-dose pharmacokinetics of opicapone was evaluated in subjects with mild (Child-Pugh: A) and moderate (Child-Pugh: B) hepatic impairment. In subjects with mild hepatic impairment, the mean overall opicapone plasma exposure (AUC) increased by 35%, which is not expected to be clinically significant. In subjects with moderate hepatic impairment, the mean overall opicapone plasma exposure (AUC) increased by 84%. Dosage adjustment for ONGENTYS is required in subjects with moderate hepatic impairment [see *Dosage and Administration* (2.2)]. ONGENTYS has not been studied in patients with severe hepatic impairment (Child-Pugh: C) [see *Use in Specific Populations* (8.7)].

Drug Interaction Studies

Clinical Studies

No clinically significant differences in the pharmacokinetics of opicapone were observed when administered concomitantly with quinidine (index substrate of P-gp [MDR1]), acetaminophen, or rasagiline.

No clinically significant differences in the pharmacokinetics of the following drugs were observed when administered concomitantly with opicapone: S-warfarin (index substrate of CYP2C9), R-Warfarin (substrate of CYP1A2 and CYP3A4), or repaglinide (index substrate of CYP2C8 and OATP1B1).

No clinically significant differences in the pharmacokinetics of the following drugs for the treatment of Parkinson's disease were observed when administered concomitantly with opicapone: rasagiline, selegiline, pramipexole, ropinirole, or amantadine.

In Vitro Studies

Opicapone does not affect protein binding of warfarin, diazepam, digoxin, or tolbutamide, in vitro.

CYP Enzymes: Opicapone is not an inhibitor or inducer of major CYPs.

Transporter Systems: Opicapone is a substrate of P-gp (MDR1) (see *Clinical Studies*), BCRP, MRP2, OATP1B3, and OATP2B1. No clinically significant transporter mediated interaction is expected for opicapone. Opicapone is not an inhibitor of P-gp (MDR1), BCRP, OAT1, OAT3, OCT1, OCT2, OATP1B3, BSEP, MATE1, or MATE2-K.

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

Carcinogenesis

No increase in tumors was observed when opicapone was administered orally to mice (0, 100, 375, or 750 mg/kg/day) for up to 2 years (84-93 weeks at the high dose). The highest dose tested is approximately 70 times the recommended dose (RHD) in humans (50 mg/day) on a body surface area (mg/m²) basis.

No increase in tumors was observed when opicapone was administered orally to rats (0, 100, 500, or 1000 mg/kg/day) for 2 years. Plasma exposure (AUC) at the highest dose tested is approximately 24 times that in humans at the RHD (50 mg/day).

Mutagenesis

Opicapone was negative in in vitro (bacterial reverse mutation test (Ames), chromosomal aberrations in human peripheral blood lymphocytes) and in in vivo (rat bone marrow micronucleus) assays.

Impairment of Fertility

In male and female rats, oral administration of opicapone (0, 100, 500, or 1000 mg/kg/day) prior to and during mating and continuing in females to gestation day 6, resulted in no adverse effects on fertility or general reproductive performance. Plasma exposure (AUC) at the highest dose tested is approximately 40 times that in humans at the RHD.

14 CLINICAL STUDIES

The efficacy of ONGENTYS for the adjunctive treatment to levodopa/carbidopa in patients with Parkinson's disease (PD) experiencing "off" episodes was evaluated in two double-blind, randomized, parallel-group, placebo- and active-controlled (Study 1, NCT01568073), or placebo-controlled (Study 2, NCT01227655) studies of 14-15 week duration. All patients were treated with levodopa/ DOPA decarboxylase inhibitor (DDCI) (alone or in combination with other PD medications). The double-blind period for each study began with a period for levodopa/DDCI dose adjustment (up to 3 weeks), followed by a stable maintenance period of 12 weeks.

Study 1

In Study 1, patients (n=600) were randomized to treatment with one of 3 doses of ONGENTYS. The intention to treat (ITT) population included patients treated with ONGENTYS 50 mg once daily (n=115) or placebo

(n=120). Baseline demographic characteristics were similar across all treatment groups: approximately 60% of patients were male, mean age was 64 years, and all patients were Caucasian. Baseline PD characteristics in the treatment groups were: mean duration of PD of 7 years for ONGENTYS 50 mg compared to 7.7 years for placebo, and mean onset of motor fluctuations of 2.2 years prior to study enrollment. Eighty-two percent of patients in both groups used concomitant PD medications in addition to levodopa; the most commonly used were dopamine agonists (68%), amantadine (23%), MAO-B inhibitors (20%), and anticholinergics (5%).

The primary efficacy endpoint was the change in mean absolute OFF-time based on 24-hour patient diaries completed 3 days prior to each of the scheduled visits. ONGENTYS 50 mg significantly reduced mean absolute OFF-time compared to placebo (Table 2).

Table 2: Study 1 - Absolute OFF-time (Hours) Change from Baseline to Endpoint

	N	Baseline Mean (SE)	LS Mean Change from Baseline (SE)	Placebo-subtracted Difference (95% CI)	Adjusted p-value ^a
Placebo	120	6.17 hours (0.162)	-0.93 (0.223)	--	--
ONGENTYS 50 mg	115	6.20 hours (0.166)	-1.95 (0.233)	-1.01 (-1.620, -0.407)	p=0.002

CI=confidence interval; LS =least squares; N=total number of patients; SE=standard error.
^a Adjusted p values were calculated using a gatekeeping procedure controlling for multiplicity.

ON-time without troublesome dyskinesia was a secondary efficacy endpoint in Study 1 (Table 3).

Table 3: Study 1 - Absolute ON-time Without Troublesome Dyskinesia (Hours) Change from Baseline to Endpoint

	N	Baseline Mean (SE)	LS Mean Change from Baseline (SE)	Placebo-subtracted Difference (95% CI)	Nominal p-value ^a
Placebo	120	9.61 (0.191)	0.75 (0.237)	--	--
ONGENTYS 50 mg	115	9.54 (0.183)	1.84 (0.247)	1.08 (0.440, 1.728)	p=0.001

CI=confidence interval; LS =least squares; N=total number of patients; SE=standard error.
^a Unadjusted p-value.

Study 2

In Study 2, patients (n=427) were randomized to treatment with either one of two doses of ONGENTYS once daily (n=283) or placebo (n=144). The intention to treat (ITT) study population included patients treated with ONGENTYS 50 mg once daily (n=147) or placebo (n=135). Baseline demographic characteristics (ONGENTYS 50 mg vs. placebo) were: mean age (66 years vs. 62 years), male (61% vs. 53%), Caucasian (78% vs. 66%) and Asian (21% vs. 31%). Baseline PD characteristics were generally similar across treatment groups with a mean duration of PD of 8.2 years, and a mean onset of motor fluctuations of 3.2 years prior to study enrollment. Eighty-five percent of patients treated with ONGENTYS 50 mg compared to 81% of patients who received placebo used concomitant PD medications in addition to levodopa; the most commonly used were dopamine agonists (70%), amantadine (21%), MAO-B inhibitors (20%), and anticholinergics (12%).

The primary efficacy endpoint was the change in mean absolute OFF-time based on 24-hour patient diaries completed 3 days prior to each of the scheduled visits. ONGENTYS 50 mg significantly reduced mean absolute OFF-time compared to placebo (Table 4).

Table 4: Study 2 - Absolute OFF-time (Hours) Change from Baseline to Endpoint

	N	Baseline Mean (SE)	LS Mean Change from Baseline (SE)	Placebo-subtracted Difference (95% CI)	Adjusted p-value ^a
Placebo	135	6.12 (0.200)	-1.07 (0.239)	--	--
ONGENTYS 50 mg	147	6.32 (0.183)	-1.98 (0.230)	-0.91 (-1.523, -0.287)	p=0.008

CI=confidence interval; LS =least squares; N=total number of patients; SE=standard error.
^a Adjusted p values were calculated using Dunnett's alpha level adjustment to control for multiplicity.

ON-time without troublesome dyskinesia was a secondary efficacy endpoint in Study 2 (Table 5).

Table 5: Study 2 - Absolute ON-time without troublesome dyskinesia (Hours) Change from Baseline to Endpoint

	N	Baseline Mean (SE)	LS Mean Change from Baseline (SE)	Placebo-subtracted Difference (95% CI)	Nominal p-value
Placebo	135	9.61 (0.206)	0.80 (0.256)	--	--
ONGENTYS 50 mg	147	9.37 (0.183)	1.43 (0.247)	0.62 (-0.039, 1.287)	p=0.065 (NS*)

CI=confidence interval; LS =least squares; N=total number of patients; SE=standard error.
 *= not statistically significant.

16 HOW SUPPLIED/STORAGE AND HANDLING

16.1 How Supplied

ONGENTYS (opicapone) capsules are available as:

- 50 mg hard gelatin capsules, Size 1; dark blue opaque cap and dark pink opaque body; axially printed with “OPC” over “50” in white ink, on both the cap and body
 - Bottle of 30 with child-resistant closure: NDC 70370-3050-2
- 25 mg hard gelatin capsules, Size 1; light blue opaque cap and light pink opaque body; axially printed with “OPC” over “25” in blue ink, on both the cap and body
 - Bottle of 30 with child-resistant closure: NDC 70370-3025-2

16.2 Storage and Handling

Store at a temperature below 30°C (86°F).

17 PATIENT COUNSELING INFORMATION

Advise the patient to read the FDA-approved patient labeling (Patient Information).

Administration

Instruct patients and/or caregivers that ONGENTYS capsules should be taken at bedtime. Inform patients to not eat food for 1 hour before and for at least 1 hour after intake of ONGENTYS [see *Dosage and Administration (2.1)*].

Concomitant Medications

Certain medications can cause an interaction with ONGENTYS. Advise patients and/or caregivers to inform their healthcare provider of all the medicines the patient is taking, including over-the-counter medicines, dietary supplements, and herbal products [see *Warnings and Precautions (5.1) and Drug Interactions (7)*].

Falling Asleep During Activities of Daily Living

Advise patients and/or caregivers that somnolence has been reported with ONGENTYS. Patients treated with dopaminergic medications have reported falling asleep while engaged in activities of daily living. These adverse reactions may affect some patients' ability to drive and operate machinery safely [see *Warnings and Precautions (5.2)*].

Hypotension/Syncope

Advise patients that ONGENTYS may cause hypotension or syncope [see *Warnings and Precautions (5.3)*].

Dyskinesia

Advise patients that ONGENTYS may cause dyskinesia or exacerbate pre-existing dyskinesia [see *Warnings and Precautions (5.4)*].

Hallucinations and Psychosis

Advise patients that ONGENTYS may cause hallucinations, delusions, or aggressive behavior and they should report any of these adverse reactions to their healthcare provider [see *Warnings and Precautions (5.5)*].

Impulse Control/Compulsive Disorders

Inform patients of the potential for experiencing intense urges to gamble, increased sexual urges, intense urges to spend money, binge eating, and other intense urges and the inability to control these urges while taking ONGENTYS and one or more medications that increase central dopaminergic tone that are generally used for the treatment of PD. Advise patients that they should report any of these adverse reactions to their healthcare provider [see *Warnings and Precautions (5.6)*].

Withdrawal-Emergent Hyperpyrexia and Confusion

Advise patients to contact their healthcare provider before stopping ONGENTYS. Tell patients to inform their healthcare provider if they develop symptoms such as fever, confusion, or severe muscle stiffness after stopping ONGENTYS [see *Warnings and Precautions (5.7)*].

For further information on ONGENTYS, call 1-833-ONGENTYS (833-664-3689) or visit www.ongentys.com
